**Report Of: Mrs. RUPALI AMOL PAWAR**

Pt. Contact: 8108926402

Sample ID 2300118044

Patient ID 1002356348

Collected on 14/07/2023

Received on 20/07/2023 10:19

Registered on 19/07/2023 18:53

Reported on 20/07/2023 13:34

Referred by **DR.SUNITA R.MORE**

### Hemoglobinopathy Screening

Patient Name: Mrs. RUPALI AMOL PAWAR

Sample Type: Whole Blood EDTA

Date of Birth/Age: 12/06/1993

Gender: FEMALE

City: MUMBAI

Method: High Performance Liquid Chromatography (HPLC)

Blood Transfusion History: No

Referral Reason or Clinical History: \_\_\_\_\_

#### About the test

Hemoglobinopathy screening by high performance liquid chromatography is a blood test that is used for detecting quantitative and qualitative abnormalities of hemoglobin (Hb), namely, Thalassemia and Structural Hb variants (e.g. HbS) respectively. The test helps identify individuals with these disorders so that they can receive timely and appropriate treatment and care. Antenatal diagnosis of these disorders allows measures to reduce the chances of the birth of an affected baby. It is also possible to screen the newborns for hemoglobinopathies using this approach, thereby decreasing the mortality & morbidity associated with conditions like Sickle cell disorder.

#### Test findings

Hb Fraction	Observed Value (%)	Expected Value (%)
HbF	0.4%	<2%
P2*	3.8%	<4.6%
HbA0	86.7%	85 - 95%
HbA2/HbE	3.0%	1.8 - 3.5%
HbD	ABSENT	Absent
HbS	ABSENT	Absent

\*The mentioned P2 value from BioRad Variant-II HPLC system is equivalent of HbA1c value in BioRad D10 system

#### Interpretation

Chromatogram shows normal hemoglobin pattern.  
Hemoglobin, PCV and RBC count are reduced. However, red cell indices are normocytic normochromic.

#### Suggestions

Please correlate clinically.

 Physician:  
 Sex:  
 DOB:  
 Comments:

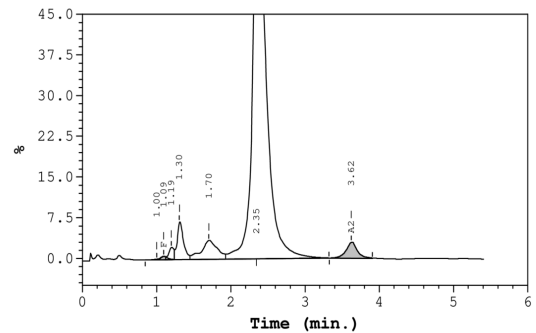

## Analysis Data

Analysis Performed: 07/15/2023 13:03:26  
 Injection Number: 3847  
 Run Number: 315  
 Rack ID: 0002  
 Tube Number: 3  
 Report Generated: 07/15/2023 14:03:44  
 Operator ID:

Analysis comments:

Peak Name	Calibrated Area %	Area %	Retention Time (min)	Peak Area
Unknown	---	0.1	1.00	1242
F	0.4	---	1.09	7972
Unknown	---	1.0	1.19	19745
P2	---	3.8	1.30	71805
P3	---	5.0	1.70	94604
Ao	---	86.7	2.35	1633536
A2	3.0	---	3.62	55422

Total Area: 1,884,325

F Concentration = 0.4 %  
 A2 Concentration = 3.0 %

## Important Blood Indices (from CBC Analysis)

Parameters	Result	Reference Range	Units
Hemoglobin (Hb)	10.74 ⚠	12 - 15	g/dL
RBC Count	3.54 ⚠	3.8 - 4.8	$\times 10^6/\mu\text{L}$
Hematocrit	29.60 ⚠	36 - 46	%
Mean Corpuscular Volume (MCV)	83.60	83 - 101	fL
Mean Corpuscular Hb (MCH)	30.30	27 - 32	pg
Mean Corpuscular Hb Conc. (MCHC)	36.30 ⚠	31.5 - 34.5	g/dL
RBC Distribution Width (RDW) (CV)	15.40 ⚠	11.6 - 14	%
RBC Distribution Width (RDW) (SD)	40.80	39 - 46	fL

## Notes:

- Recent blood transfusions and iron deficiency can interfere with the results, repeat testing is recommended three months after the last blood transfusion. In case of iron deficiency, it is recommended to evaluate the result post-correction of iron deficiency.
- Megaloblastic anemia can cause elevated HbA2 levels. A repeat assay is recommended after correction of VitB12 deficiency.
- Mild to moderately elevated fetal hemoglobin (HbF) values are observed during pregnancy, hypoxia, chronic kidney disease, use of certain drugs, myelodysplastic syndromes (MDS), aplastic anemia and conditions of stress hemopoiesis.
- Cases with borderline HbA2 levels (3.1-3.9%) could represent Silent Beta-thalassemia trait, or co-existent iron deficiency or Alpha-thalassemia in a case of Beta-thalassemia trait. They need to be investigated further by appropriate tests.
- Confirmatory molecular tests for Beta-thalassemia traits and abnormal hemoglobin disorders (e.g. HbS, HbE, and HbD), followed by subsequent prenatal diagnosis (if required) are available at our centre.
- The mentioned P2 value from BioRad Variant-II HPLC system is equivalent of HbA1c value in BioRad D10 system

## Disclaimers:

- The Hb-HPLC is a screening test that detects Beta-thalassemia and other hemoglobin variants. It does not identify Alpha-thalassemia and Silent Beta-thal-assemia carriers. DNA analysis is recommended to rule out Alpha-thalassemia and Silent Beta-thalassemia carriers.
- The result must be interpreted in conjunction with the complete blood counts (CBC), VitB12 and iron profile of the individual.
- Each sample received at Lilac Insights' processing centre is handled with the utmost sensitivity and care. All samples received on Sundays and National holidays are stored as per specific guidelines for the respective specimens and processed on the next day.
- P2 peak in Bio Rad's Variant II HPLC platform represents glycated hemoglobin. It is elevated in uncontrolled diabetes.
